
RN-15/IDDP-2 now at 4.254 m deep

Drilling has progressed slowly but steady for the last few weeks. Since 3200 m depth we have been drilling without getting any return of circulation fluid or drill cuttings to the surface. Seven times we have attempted to drill for spot cores, providing us with valuable rock samples for detailed petrological and petro-physical research.

**Figure 1** shows the drilling progress while **Figure 2** gives a glimpse to the drill cores.
